softwerx

A Microsoft 365 Security Case Study

Leading Research Charity

The Challenge

The charity's on premise infrastructure was out of date and needed modernising, but new servers are expensive. After reviewing the options, they decided that the best option for a cost effective solution that would enable their staff to work where and when they needed to was to move to the cloud.

They worked with Softwerx to migrate their applications, then asked for support securing their new cloud environment.

The Solution

As part of the migration Softwerx had ensured that the vital, and often overlooked standard security features within Microsoft 365 were enabled, but the charity needed more.

Softwerx were able to use their Microsoft expertise to add another layer of security to the system, without compromising on access.

> *We'd moved our applications to the cloud, but we needed to secure them. That's where Softwerx came into their own.*

The Outcome

Now their systems are in the cloud the charity is able to keep their software fully up to date without the added costs of managing and updating an in-house server. Staff are able to work from home or connect from the road quickly easily and securely.

The added security of the Softwerx setup has given them confidence that they are fully compliant with all data protection directives and in control of access.
