

# A Microsoft 365 Security Case Study

Leading UK Financial Advisors

## The Challenge

Having moved our infrastructure to Azure, the Microsoft Cloud, they needed to ensure it was secure.

Like any security posture, cloud based security is based around knowing your data and systems are safe, having visibility of your current security status, knowing immediately if something happens and tracing and responding to unexpected events.

Where it differs is in the types of attack surface, an on-premise system has very different access points to a cloud based one.

## The Solution

Initially, Softwerx helped the firm understand their Microsoft environment.

In particular, they covered how to make better use of some of the technology the business was already paying for.

As well as reviewing the licensing to ensure the business were getting the best possible value for money Softwerx developed and implemented a comprehensive security plan.

*Engaging with a Softwerx subject matter expert, particularly around Microsoft licensing was one of our best decisions.*

## The Outcome

With Softwerx managing their 365 community, they now have a comprehensive and deep view of their Microsoft Cloud Environment. Protecting their environment involves giving them complete visibility of the status of the system and patterns making it possible to spot, and respond to, unexpected events.
